RESQORA

Complete Feature Catalog

A consolidated reference for the current emergency-response app, including mobile, backend, media, chat, public tracking, and deployment features.

Current app	Expo React Native + Supabase Edge API
Emergency media	Photos and short videos
Public access	Read-only browser tracking link
Maps	OpenStreetMap and Leaflet

Prepared from the current RESQORA source and deployment configuration.

1. Authentication and account

- User registration and login with email/phone and password.
- Secure password hashing, Supabase Auth integration, logout, and persistent sessions.
- Password reset by email with mobile deep-link recovery.
- Profile information: name, phone/email, member date, SOS statistics, and times helped.
- Expired-token handling and automatic authentication gating.

2. Home screen

- You are safe state, current location, nearby responder count, and active SOS detection.
- Resume an active SOS after reopening the app.
- Nearest police stations, hospitals, and emergency hotline shortcuts: 112 and 108.
- Open directions through the phone's map application.
- Connection status and active-SOS warnings.

3. Creating an SOS

- Dedicated emergency trigger screen with a three-second hold-to-send control.
- Five-second cancellation countdown, Send now action, and false-alarm cancellation.
- Automatic send when the countdown reaches zero.
- High-accuracy GPS location attached to the SOS.
- Editable message with a 300-character limit and a default emergency message.
- Two-kilometre default alert radius and nearby-user alerting.
- Duplicate active-SOS prevention, reopen-existing-SOS flow, and stuck-SOS clearing.

4. Photos and videos

- Take or choose one photo before or during an SOS; replace or remove it.
- Record or choose one video; maximum 30 seconds and 20 MB.
- Supported video formats: MP4, MOV, and 3GP.
- Supported image formats: JPEG, PNG, WebP, HEIC, HEIF, and GIF; maximum 5 MB.
- MIME-type and file-size validation.
- Private Supabase Storage, signed URLs, loading states, full-screen photo viewing, video playback, and download links.
- Media is visible in the sender screen, responder alert, responder navigation, history, and public tracking page.

5. Active SOS screen

- Live banner, elapsed timer, map, victim marker, responder markers, and movement updates.
- Alerted count, coming count, responder names, distances, and statuses.
- Statuses: Alerted, On the way, Arrived, and Not coming.

- Current message and attached media display with replacement support.
- Tracking link copy, native share sheet, and SMS sharing to saved contacts.
- End-SOS confirmation and protection against accidentally leaving an active emergency.
- State restoration after app switching, backgrounding, reopening, and network reconnection.
- Supabase Realtime plus polling fallback.

6. SOS group chat

- Private chat for each active SOS between the sender and attached responders.
- Messages show sender names and chronological order.
- Multiline composer with a 500-character limit and current-user styling.
- Automatic refresh every five seconds, loading state, and empty-chat state.
- Server-side participant authorization and chat closure when the SOS ends.
- Messages are stored in Supabase and the table is enabled for Realtime.
- The public tracking page shows a read-only copy; public visitors cannot send messages.

7. Responder features

- Nearby SOS alerts with in-app overlay, sound, vibration, victim details, distance, and media.
- I'm on my way, I've arrived, and I can't make it actions.
- Live responder location, distance recalculation, route display, and directions handoff.
- Status synchronization, app-background restoration, and automatic removal when an SOS ends.

8. Emergency contacts

- Add, view, and delete contacts; name and phone validation; maximum five contacts.
- Duplicate phone prevention and remote Supabase storage.
- Text my contacts opens the native SMS composer with the SOS message and tracking link.
- The active SOS screen receives the saved contact list and disables the action when empty.
- RESQORA does not silently send SMS or use a paid SMS gateway.

9. Public browser tracking link

- No app or account required; works in a normal browser over mobile data.
- Live map, address, elapsed time, alert count, coming count, responder names, distances, and statuses.
- Custom message, photo/video playback, media download, and read-only SOS group chat.
- OpenStreetMap tiles and Nominatim reverse geocoding; no Google Maps API key.
- Polls every ten seconds and shows an ended-emergency state.
- Visitors cannot send chat messages, respond, change status, end the SOS, or modify data.

10. Maps and location

- OpenStreetMap and Leaflet maps rendered in the app and browser viewer.
- Live victim/responder markers, auto-fitting, route line, full-screen map, and coordinate fallback.
- Current GPS, background updates during an SOS, Haversine distance calculations.
- Reverse address lookup and police/hospital search through OpenStreetMap services.
- Directions handoff to the device's map application.

11. Safety timer

- Preset durations: 10, 20, 30, and 60 minutes.
- Custom seconds, minutes, or hours from one second to 24 hours.
- Server-based expiry timestamp survives app switching and reopening.
- Extend, check in, cancel, and automatic SOS creation on expiry.
- Uses last stored location, alerts nearby responders, and protects against duplicate expiry.
- Supabase scheduled job handles expiry when the app is closed.

12. History

- Previous SOS events grouped by day with start time, duration, message, media, and responder information.
- Photo viewing and video playback from history using signed URLs.
- Resolved/active status, active-SOS reopening, pull-to-refresh, loading, and empty states.

13. Notifications and reliability

- Foreground alert overlay, sound, vibration, Expo push-token registration, and offline push support.
- Realtime delivery with polling and reconnection fallbacks.
- Readable network and non-JSON server errors.
- Array normalization prevents length/render crashes.
- Duplicate SOS and responder prevention, media fallbacks, loading/empty states, and cleanup on unmount.
- Android back-button warning during an active SOS and HTTPS-only production API.

14. Backend, security, and storage

- Supabase Edge Function API, Postgres, private Storage, and Realtime.
- Custom signed RESQORA tokens and protected authenticated routes.
- Server-side service-role key, Row Level Security, participant authorization, and signed media URLs.
- Location, radius, message length, MIME type, and file-size validation.
- Atomic safety-timer expiry, CORS, JSON errors, and no production dependency on the legacy local server.

15. Android distribution

- Expo React Native and Expo Router app with EAS preview APK builds.
- Signed Android package: com.resqora.app.

- OTA updates on the preview channel and native expo-video support.
- Source repository: https://github.com/Eklavya-Yadav-1711/RESQURA
- Public viewer: https://eklavya-yadav-1711.github.io/RESQURA/

16. Current limitations

- WhatsApp-style in-app voice/video calling is not implemented.
- Native phone calls can be added through the device dialer.
- The public chat is intentionally read-only.
- Anyone holding an unguessable public token can view that SOS's shared data.
- Internet is required for the Supabase API, live tracking, map tiles, and media URLs.
- Only one media attachment is supported per SOS; videos are limited to 30 seconds and 20 MB.
- Native push notifications require correct Android Firebase/EAS credentials.
